Realm of Pixels and Color Models: Challenge 2

Reflection:

For this assignment, I chose the "Realm of Pixels and Color Models" challenge and decided to create a comic strip instead of a traditional poster. Initially, I was interested in creating something more engaging than a list of definitions or technical explanations. Since the goal of the assignment was to present image processing concepts in a creative way, I wanted to build a story that connected the concepts of pixels, RGB, and HSV to a real-world Computer Vision scenario.

One aspect of this project that I found particularly interesting was connecting concepts that I was already familiar with to the fundamentals of image processing. Before this assignment, I

already understood that AI systems work with numerical representations rather than perceiving the world the way humans do. However, this activity helped me better connect that idea to pixels and color models. Instead of thinking only about numbers and algorithms, I spent more time considering how visual information is represented before it can be analyzed by a computer vision system.

This project helped me better understand the practical differences between RGB and HSV color models. RGB represents colors using red, green, and blue values, while HSV separates color information into hue, saturation, and value (brightness). I found it interesting that different color models can represent the same image in different ways depending on the needs of the application.

When developing the comic strip, I chose the concept of "AI Vision Glasses" because it allowed me to present the material as a learning journey. Instead of traveling through a fantasy world, the main character explores how a computer vision system interprets images. This approach felt more relevant to Artificial Intelligence and Computer Vision while still maintaining the creative and interactive spirit of the assignment.

I also used generative AI tools to help create the visual elements of the comic. However, the concepts, storyline, character design decisions, and educational content were carefully planned and refined throughout the project. This experience showed me how AI can be used as a creative tool while still requiring human judgment, critical thinking, and subject understanding. Overall, this assignment helped me strengthen my understanding of image representation and reinforced the importance of pixels and color models as foundational concepts in Computer Vision.
